

Alaa Same Akasha

Solution Consultant | Project Manager

Education

- University degree, masters, Universitetet of Oslo
- University degree, bachelors, Universitetet of Oslo

Certifications

- PRINCE2 Agile® Foundation Certification - Project Management
- Scrum Master
- ISTQB® Foundation Level Certificate - Certified Tester (CTFL)
- Microsoft Certified: Azure Fundamentals (AZ-900)
- Conflict Resolution skills

Courses

- Fundamentals of Azure AI services
- Fundamentals of machine learning
- Teaching Recovery Techniques (TRT)

Highlighted roles

- Project manager
- Strategy Consultant
- Test Manager
- Web Front-end Developer

Languages

- Norwegian
- English
- Arabic

I am an analytical and structured technologist with expertise in project management, quality assurance and agile delivery management. I have experience from mission-critical projects where coordination, team leadership and structured execution have been central. With a master's degree in Digital Economics and Management, combined with practical experience as a Test Lead, Scrum Master and frontend developer, I have a solid foundation for a project manager role.

I have led teams in complex delivery processes, established collaboration structures and contributed to process improvements that resulted in better quality and increased predictability. As Test Lead in the Brønnøysund Register Centre's Apollo programme, I managed testing work and modernized work processes. In the METEOR project for Finans Norge, I ensured quality, and at Møller Mobility Group, I led a team as Scrum Master through analysis, sprint planning and solution development.

ASSIGNMENTS

Apollo

Customer: BRØNNØYSUNDREGISTRENE
Duration: Mar 2025 - Apr 2026
Roles: Test Manager

Test Management	Smidig Projectmethodology	Jira	Confluence	Scrum	ISTQB	GitHub	Allure
-----------------	---------------------------	------	------------	-------	-------	--------	--------

Apollo is a program area that quality assures functionality related to the Register of Business Enterprises, across multiple business entity types (including sole proprietorships, associations, limited companies, and general partnerships). The solution has high legal complexity with extensive regulations and dependencies between sub-projects, and is critical to society because it affects a large number of users and businesses in Norway. The need was to ensure accuracy, reliability, and compliance with regulatory requirements throughout development, while integrations, automation, and manual testing were coordinated across teams. The project's purpose was to establish predictable, risk-based test management and traceable execution, so that changes can be deployed to production with high quality and low risk.

The project established a more efficient delivery flow, with clearer prioritization and better communication between sub-projects, integration testing, automation, and development. An adjusted standup rhythm (three times per week) provided more focused work time and faster clarifications, contributing to earlier defect detection, more accurate regression, and better compliance with regulations. The solution has achieved higher predictability in test execution and better traceability from requirements to tests and defects, reducing risk during production deployment in an ongoing, complex process.

Role in the project - Test Manager:

I served as test lead for a core team of one resource with flexible scaling to 1–6 testers as needed, including both internal and contracted resources. My responsibilities included planning and managing the test strategy and test plan, risk management, prioritization of test scope, and coordination of integration testing in collaboration with automation and development teams. I established and maintained ceremony cadence, including standups and weekly summaries, quality assured acceptance criteria, and ensured compliance with legal and regulatory requirements in the test basis. I also managed defect follow-up, reporting to stakeholders and continuous process improvements that increased pace and quality in deliveries.

I applied agile methodology, mainly Scrum, with a risk-based approach to testing. I used Jira for requirements, task and defect management, and Confluence for structured test documentation, decision logs and traceability. My test activities included functional testing, acceptance testing, regression testing, and coordination with integration and automated tests. Cross-functional collaboration, clear facilitation and continuous improvement were central to my delivery approach in a complex and regulation-driven domain.

METEOR

Customer: FINANS NORGE FORSIKRINGSDRIFT
Duration: Dec 2023 - Jun 2024
Roles: Test Manager

Jira	Confluence	Business Analyst	Web Content Accessibility Guidelines (WCAG) 2.0	Cypress
Test Automation	Testing Process	Test Management	Scrum	GitHub

The METEOR project aimed to develop and quality assure new solutions for handling data and processes related to the damage and insurance area in the Norwegian insurance industry. The solution had high requirements for accuracy, stability, and regulatory compliance, as it affects all participants in the Natural Disaster Pool and requires uniform processes across systems and suppliers. The project needed a robust and structured test organization that could ensure quality in both backend and frontend topics, as well as verify automation processes, interfaces, and data processing. For the client, it was crucial that the solution was delivered with high quality, predictability, and traceability, and that the functionality could be safely implemented further into operations.

The project resulted in a successful delivery that met the client's expectations for functionality, performance, and quality. The delivery was accepted and taken further into operations, and the client expressed satisfaction with the quality of the work and the form of collaboration. Through good control of risks and defects, errors were identified and handled early in the process, which reduced rework, strengthened stability, and increased the pace of delivery processes. The delivery has contributed to increased operational reliability, better internal traceability, and more precise processes in an area where errors carry high costs for the industry. The result created greater confidence around further development and future implementations.

Role in the project - Test Manager:

I had responsibility as both test lead and test analyst for a team from the supplier. My areas of responsibility included planning and execution of test runs, defining test scope, risk assessment, prioritization and coordination with backend, frontend and automation teams. I conducted functional testing, verified deliveries against requirements, performed defect management and reported progress to project management and the client. I also contributed to quality assurance of automation runs and supported the team in establishing good test procedures.

My structure, communication skills and technical understanding contributed to the project being delivered with high quality and without delays, giving the client predictability and confidence in a technically complex delivery area. I worked in an agile delivery setup with focus on close collaboration and continuous improvement. I used Jira for planning, task management and defect management, while Confluence was used for documentation and traceability. My testing work included functional testing, regression testing, requirements review and quality assurance of automation runs, as well as evaluation of API and frontend functionality. I used methodical test analysis, structured test design and risk-based prioritization. Collaboration in cross-functional teams and clear communication with development, management and other dependent parties were key parts of my work in the project.

PGSA, PAS and BOGI

Customer: UTDANNINGS DIREKTORATET

Duration: Aug 2023 - Dec 2023

Roles: RPA Tester, RPA Tester

ISTQB Certified Tester Foundation Level

Jira

Test

Power Point

Acceptance Testing

Regression testing

Test design

Scrum

The Directorate for Education has large and complex systems that are constantly evolving. Three of the most important systems are PAS, PGSA, and BOGI, which are essential for the development, administration, and execution of digital exams and tests, as well as the management of various forms for kindergartens and schools. These systems are designed for a high number of users taking tests and exams, making thorough testing crucial to ensure proper functionality on exam day.

PGSA is being phased out in favor of the new execution system, EPS. This transition requires testing key functionalities to identify errors as early as possible, along with regression testing to ensure that issues are resolved and to build confidence in the systems.

PAS is a system that administers diagnostic and national tests for primary schools. It requires precise functional and device testing to uncover errors as early as possible.

BOGI is the Directorate for Education's electronic reporting system for collecting data on kindergartens and primary schools in Norway. It requires thorough testing of the various forms to detect errors as early as possible.

Role in the project - RPA Tester:

I was responsible as a functional tester and worked closely with a test lead from the supplier. I performed functional testing, acceptance testing, regression testing and device testing across all three systems. My work included reviewing requirements and acceptance criteria, developing and executing test cases, documenting findings, and following up defects with development teams. I contributed to safe test execution in an environment with high demands for quality and accuracy. By working in a structured, detail-focused and consistent way, I strengthened the quality of deliverables and contributed directly to safer exam administration and data collection.

The methodology encompassed systematic functional test design, acceptance testing, regression testing, and device testing to ensure quality across different platforms and user groups. The testing work was carried out within agile frameworks, using Jira for task and defect management as well as structured processes for risk assessment and prioritization. Strong domain insight, understanding of highly sensitive and heavily regulated functionality, and the ability to collaborate closely with the test lead and development teams were key competencies in the project.

Role in the project - RPA Tester:

I worked with testing of the trial and examination system for UDIR. My role was to quality assure the systems in different phases, including acceptance testing, device testing, functional testing and non-functional testing.

Corporate Entrepreneurship

Customer: Møller Mobility Group AS

Duration: Aug 2022 - Dec 2022

Roles: Scrum Master

It project management

Scrum Master

Teamwork

Data analysis

Strategy development

Power Point

Trello

Miro

Agility

The customer wanted to explore and further develop the opportunities related to Connected Cars and data-driven automotive products. The company needed to clarify how a new digital unit, a device installed in the cars, should be managed going forward: either as an internal development and operations area, or via an external third-party supplier. The question revealed several underlying challenges, including assessment of cost levels, long-term dependency, technical quality, data security, scalability, and organizational maturity. The project's purpose was to develop a comprehensive decision basis and a practical recommendation for how the Connected Cars initiative should be realized in the organization, based on insights into market, technology, economics, and value chain.

The project resulted in a documented and holistic data-driven recommendation, combined with a concrete solution outline that the customer later adopted as part of their assessment of the further direction for the Connected Cars area. Through analyses of market position, competitive landscape, technical possibilities, and cost models, the customer gained increased clarity on which solutions were most sustainable both economically and operationally. The delivery included visualized models, analyses, decision-making foundations, and a thoroughly developed strategy for how Møller can reduce risk while simultaneously realizing greater value from vehicle data and customer insights. The result strengthened the company's ability to make informed decisions about a strategically important initiative and provided a practical framework for further implementation.

Role in the project - Scrum Master:

I held the role of Scrum Master for a cross-disciplinary student group of four to five consultants who worked integrated with the client's organization three days a week. My areas of responsibility included facilitating daily standups, sprint planning, task distribution, progress management and risk management. I ensured that the team followed agile principles, secured continuous communication with the client, and coordinated deliveries from analysis to presentation. In addition, I participated in validating insights, structuring findings, quality assuring analyses and developing presentation materials that the client could take forward. Through clear structure, coordination and the ability to drive progress, I contributed to high productivity and deliveries of good quality.

I worked with agile methodology, focusing on continuous improvement and cross-disciplinary collaboration. The team used Trello for sprint management, task handling and prioritization, and Miro for concept development, process visualization and structuring of insights. My analytical work included financial assessments through Excel-based models, market analysis, technology assessments and strategic decision-making frameworks. I applied competence in facilitation, agile project work, structured information gathering and stakeholder dialogue, which contributed to a delivery of high quality and strong practical value for the client.

Software engineering

Customer: FREMTIND FORSIKRING
Duration: Jun 2022 - Aug 2022
Roles: Web Front-end Developer

Communication & co-operation Agile Principles TypeScript Figma React

In this project, the goal was to develop an internal system using the React framework and Fremtind's own source code framework and APIs. The work was carried out in a team, with a primary focus on efficiently managing customer feedback through filtering, sorting and routing to different departments within Fremtind. A user-friendly interface was created to help users handle feedback quickly and effectively. Through this project, I gained experience with project planning, design, product development, testing and project delivery across multiple iterations.

Role in the project - Web Front-end Developer:

I was responsible as a frontend developer in a cross-disciplinary team. This included designing and developing the user interface using React and TypeScript, with focus on accessibility, usability and efficient interaction. I collaborated closely with designers, backend developers and project management to ensure functional and technical quality in each iteration. My tasks included implementation of filtering and sorting logic, integration with internal APIs, quality assurance through testing, and iterative improvement based on user needs. Through structured collaboration, clear dialogue and holistic understanding, I contributed to a solution that created concrete value for the customer.

I worked with modern frontend technology such as React and TypeScript, combined with the customer's internal component library and API platform. The working method was rooted in agile principles, with cross-disciplinary collaboration and iterative delivery. I used user-supporting design tools such as Figma to ensure consistent and user-friendly visual design. Communication, requirements understanding, interaction design, frontend development, testing and agile methodology were central throughout the project.

FORMAL EDUCATION

2021 - 2023	University degree, masters, Universitetet of Oslo The Master's programme in Digital Economics and Management equips graduates with specialized expertise in technology, business, and digital transformation, enabling them to lead organizations through digital change and leverage opportunities in the digital economy.
2018 - 2021	University degree, bachelors, Universitetet of Oslo Bachelors in Informatics, providing a solid understanding of the digital economy, programming languages, UX, and computer science. Proficient in programming and designing user-friendly applications.

WORKING METHODS AND TECHNOLOGY COMPETENCE

Technologies	Kotlin, JavaScript, HTML/CSS, React, Agile, Test Management, GitHub, Power Point, Allure, Test Automation
Methodologies	Scrum Master, Teamwork, Data analysis, Strategy development, UX, Problem Solving and Decision Making, Scrum, Frontend, Test, Communication & co-operation, Test Management, Smidig Projectmethodology, ISTQB, ScrumBan

Tools	Interaction design, Git, Confluence, Jira
